

Thinix iStatus® Desktop

Powerful Network Monitoring Platform

iStatus Desktop is a user-friendly desktop application specifically designed for non-technical users to receive notifications when Internet connections or network resources are unavailable. Alerts let staff know when a business is operating on a backup Internet connection and when their primary connection comes back online. ARPWatch™ technology adds another layer of protection by defending PC's from ARP poisoning – keeping data and credentials protected. iStatus Desktop can be installed on Windows-based point-of-sale systems, kiosks, and office staff PCs.

Simple Monitoring For Non-Technical Users

iStatus is easily installed, cost efficient, and easily deployed to multiple machines. Instead of having to adjust multiple parameters for each target, users may select the sensitivity of each monitored connection point. iStatus Desktop Alerts allow you to easily diagnose connection problems; when coupled with iStatus Cloud, IT staff are empowered to respond quickly and proactively.

Primary Features:

- Monitor connectivity & critical network services on every PC
- Inform non-technical users when cloud services are down
- ARPWatch alerts and defends against ARP poisoning attacks
- Correct Status eliminates stale notification messages
- Enterprise Ready features help IT resolve issues
- Root-Cause Analysis performed automatically to pinpoint problems
- Silent Background testing
