Thinix®

About

Founded in 2003, our original vision was to build an easy-to-use, guest PC to allow guests to securely and reliably connect to the Internet. Our guest PC needed to securely erase user's history and be immune to misconfiguration. We achieved these goals, and Thinix has evolved to be a leader in the technology industry by providing guest PCs, managed WiFi, and other high-value services needed to drive business success for our partners.

We strive to continuously innovate and improve our technologies to broaden our product line. Thinix helps businesses leverage technology to drive revenue while not losing focus on the bottom-line cost.

Our managed WiFi solutions have achieved some of the highest satisfaction scores across multi-industry partnerships. We now have over 17,250 managed endpoints and 150 million hours of secure uptime without any notable security breaches or incidents. Thinix technologies have been implemented in countless applications and are deployed in over 120 countries. Thinix technology is used by a diverse base of industry-leading partners in hospitality, healthcare, government, business, retail, military, and education.

Through our continued research, development, and commitment to innovate industry-leading solutions, we have developed a full line of world-class products that are reliable, secure, and simple to use. It is our hope that you will explore our solutions and that we can help your organization leverage technology to drive your business success.

Our Vision

Thinix vision is to be the trusted choice for managed technology solutions; we furnish our worldwide customer base with distinct business advantages by making technology simple, safe, and secure.

Thinix

Managed Endpoint Security For PCs
Our flagship product protects all of the endpoints in our organization.

Managed Backups & Disaster Recovery
Fully managed cloud backup service with Business Continuity and Disaster Recovery - recover in the event of ransomware, viruses, or hardware failures.

Advanced Email Filtering
Cloud based email filtering, antivirus, anti-phishing, secure email, email archiving, and on-click URL inspection.

Managed Perimeter Security
Fully managed firewall service, content filtering, real-time traffic scanning, offsite logging, and security updates.

Thinix AssuredSecurity®

Managed Endpoint Security For Business PCs

Thinix AssuredSecurity® is a managed security service used to dramatically strengthen and support the ongoing security disposition of your front-office computers. Thinix AssuredSecurity combines a number of otherwise separate processes (security settings and policies, PC updates, application updates, antivirus, auditing, etc.) and technology into a single managed security service. Our partners can expect a higher level of security at a lower cost than businesses would be able to achieve using traditional means.

Managed Backups & Disaster Recovery

With three secure copies — two media types and one offsite type — critical business data is always safeguarded with 321-Backup®. From one PC to thousands, 321-Backup makes enterprise backup monitoring and storage easy across entire companies. Strengthened by a cloud-based architecture, 321-Backup mitigates data loss by providing an affordable and scalable backup platform to ensure business continuity. HIPAA & PCI compliance, 24/7 monitoring, and military-grade data encryption keep data safe and protected from threats such as ransomware.

Advanced Email Filtering

As a cloud-based security service, Thinix offers modusCloud™ protection for Office 365, which is scalable and flexible for any business. Our approach uses a layered defense to stop spam, phishing, and malicious emails before they reach your staff — reducing the possibility of your network security and integrity from being compromised. In addition, you receive the ability to encrypt messages that contain valuable data, retain your emails with archiving for up to 10-years, and have your staff educated and trained by Thinix on proper email protocol and procedures to avoid potential threats.

Managed Perimeter Security

Thinix delivers full-strength firewall threat management to safeguard intellectual property, data, confidential records, and more. One-click access to built-in PCI and HIPAA reports provide insights and auditing to ensure compliance requirements are covered. Thinix Managed Firewalls protect critical attack areas and includes URL filtering, application control, data loss prevention, and are fully-managed by Thinix network security engineers and support staff.
